What Are Kidney Stones?

Kidney stones are hard mineral deposits that form in the kidneys when urine becomes concentrated, allowing minerals to crystallize. These stones can travel through the urinary tract, causing immense pain, bleeding, and possible infections.

Symptoms of Kidney Stones

Recognizing early signs is critical for timely treatment. Common symptoms include:

- ◈ **Sharp pain** in the lower back, abdomen, or sides
- ◈ **Burning sensation or blood in urine**
- ◈ **Frequent or interrupted urination**

- ◈ **Nausea and vomiting**
- ◈ **Fever or chills**, which may indicate infection

If you experience any of these symptoms, consult a urologist immediately.
